CARD TRADER · FOR THE ACCOUNT OWNER

Getting the app ready to sell in Google Play and the App Store

You already created the two developer accounts. A few steps can only be done by you as the owner. After that, your developer does all the technical work. Tick each box as you finish the step.

About 1 hour
of your time, spread over a few days

$4.99 one-time unlock
you receive about $4.24 per sale

Paid by Google and Apple
monthly, into the bank account you add below

The one rule: invite, don’t share. Never send anyone your passwords or the codes Google and Apple text you. Both stores let you **invite** your developer with their own login, and you can remove that access any time.

1. Google Play Console `play.google.com/console`

- [ ] **Finish any account verification Google asks for**

  Open the Play Console. If the home page shows a banner such as “Verify your identity” or “Complete your account details”, follow it to the end. Google may ask for ID or, for a company, a D-U-N-S number.

- [ ] **Add your bank account and tax details**

  Go to `Setup › Payments profile` and fill in your business name, address, bank account and tax information. Without this, Google can’t sell the $4.99 unlock or pay you.

- [ ] **Invite your developer**

  Go to `Users and permissions › Invite new users`. Enter the email address your developer gives you, choose **Admin (all permissions)**, then **Invite user**. Tell your developer it’s sent.

- [ ] **Start collecting 12 testers**

  Google requires new personal developer accounts to test an app with **at least 12 people for 14 days** before it can go public. They need an Android phone and a Gmail address, and they just install the app from a link; nothing to pay.

  Start now: friends, family and regulars from card shows all count. Send your developer the 12 Gmail addresses. (If your account is registered as a company, ask your developer whether this applies to you.)

2. Apple App Store Connect `appstoreconnect.apple.com`

- [ ] **Accept the Paid Apps agreement**

  Sign in with the Apple ID you used to join the Developer Program. Go to `Business › Agreements` and accept the **Paid Apps** agreement. (On older screens this is called “Agreements, Tax, and Banking”.)

- [ ] **Add your bank account and tax forms**

  On the same page, add the bank account and complete the tax forms Apple shows you (US: W-9; outside the US usually W-8BEN, or W-8BEN-E for a company), plus a contact for payments.

  Check back in 1–3 days: the Paid Apps agreement must show **Active**. Until then, Apple won’t sell anything, even in testing.

- [ ] **Invite your developer**

  Go to `Users and Access › + (Add)`. Enter your developer’s name and email, choose the role **Admin**, and if you see **Access to Certificates, Identifiers & Profiles**, tick it. Then **Invite**.

3. RevenueCat `app.revenuecat.com`

- [ ] **Create a free RevenueCat account and invite your developer**

  RevenueCat connects the app to both stores and tells it who has paid. It never handles money and is free until the app earns $2,500 a month. Sign up with your business email, create a project called **Card Trader**, then go to `Project settings › Collaborators` and invite your developer.

4. Send these to your developer

- [ ] **A message that all three invites are sent**

  They accept the invites from their own email.

- [ ] **The 12 testers' Gmail addresses**

  For Google's 14-day test (step 1.4). Add your own address too.

- [ ] **The store listing details**

  A support email address customers can write to, a one-line description of the app, your website (if any), and whether the price is $4.99 in every country. Your developer prepares the screenshots and a privacy policy page for you to approve.

Your developer does the rest

- Creates the app and the $4.99 product in both stores
- Connects RevenueCat and the app's server
- Uploads test versions and runs the 14-day test
- Submits the app for Google and Apple review

Never send anyone

- Your Google or Apple password
- The codes texted to your phone
- Bank details (they only go into Google and Apple)

Your last job comes later: when your developer says the test version is ready, you'll buy the unlock on your own phone as a tester. Test purchases are free and show "test" on the payment screen. Menu

names in the stores sometimes change slightly; if you can’t find a step, send your developer a screenshot.
